In computing, aspect-oriented programming is a programming paradigm that aims to increase modularity by allowing the separation of cross-cutting concerns. It does so by adding additional behavior to existing code without modifying the code itself, instead separately specifying which code is modified via a "pointcut" specification, such as "log all function calls when the function's name begins with 'set'". This allows behaviors that are not central to the business logic to be added to a program

The good news is that something like that does exist: aspect-oriented programming (AOP). It separates general code from aspects that cross the boundaries of an object or a layer. For example, the application log isn't tied to any application layer. It applies to the whole program and should be present everywhere.

In computing, aspect-oriented programming (AOP) is a programming paradigm that aims to increase modularity by allowing the separation of cross-cutting concerns. Cross-cutting concerns are aspects of a program that affect other concerns.

~~An introduction to Aspect-Oriented Programming~~

Aspect Oriented Programming Aspect Oriented Programming (AOP) allows us to keep the original code as-is, and provides us a way of weaving an aspect (e.g. logging) into the code. An aspect is supposed to be defined in a generic way so that it can be applied to many objects in the application.

~~Aspect-Oriented Programming (AOP) in C# with SOLID~~

Aspect-oriented programming gives you a way to encapsulate this type of behavior functionality. It allows you to add behavior such as metrics "around" your code. For example, AOP provides you with programmatic control to specify that you want calls to BankAccountDAO to go through a metrics aspect before executing the actual body of that code.

~~Chapter 1. What Is Aspect-Oriented Programming?~~

Aspect-Oriented Programming. Aspect-Oriented Programming (AOP) is a programming paradigm which complements Object-Oriented Programming (OOP) by separating concerns of a software application to improve modularization. The separation of concerns (SoC) aims for making a software easier to maintain by grouping features and behavior into manageable parts which all have a specific purpose and business to take care of.

~~Aspect-Oriented Programming—Read the Docs~~

The motivation for aspect-oriented programming approaches stem from the problems caused by code scattering and tangling. The purpose of Aspect-Oriented Software Development is to provide systematic means to modularize crosscutting concerns. The implementation of a concern is scattered if its code is spread out over multiple modules. The concern affects the implementation of multiple modules.

~~Aspect-oriented software development~~

Aspect Oriented Programming (AOP) compliments OOPs in the sense that it also provides modularity. But the key unit of modularity is aspect than class. AOP breaks the program logic into distinct parts (called concerns). It is used to increase modularity by cross-cutting concerns. A cross-cutting concern is a concern that can affect the whole application and should be

Spring AOP (Aspect-oriented programming) framework is used to modularize cross-cutting concerns in aspects. Put it simple, it's just an interceptor to intercept some processes, for example, when a method is execute, Spring AOP can hijack the executing method, and add extra functionality before or after the method execution.

In this article, we will consider aspect-oriented patterns usage instead of commonly used OOP. Although AOP has existed for some time now, developers usually prefer OOP over AOP. While everything you do with AOP can be done with OOP as well, like procedural programming vs. OOP, AOP gives developers more choice in the paradigms they can use.

Developed in the 1990s, aspect-oriented programming (AOP) provides us attribute/ aspect components we can use in our classes at every level. These aspects exist as metadata for our classes which we can implement at run time to provide the required services on an as needed basis.
