MATLAB. As a verification method, a finite element code using ANSYS is also developed. The effects of lamination angle, plate aspect ratio and modulus ratio on the fundamental natural frequencies of a laminated composite are also investigated and good agreement is found between the results evaluated and those available in the open literature.

Next, we study the effects of some parameters on forced vibration of the shell structure; we consider a fully clamped composite shell consisting of ten composite layers with the following geometrical parameters: the length a = 1 m, the width b, the thickness h, and radii of the shell R x = R y = R; material parameters are shown in Tables 1 and 2. All cases of graphene reinforcement are UD-type, X-type, O-type, and V-type as mentioned.
