recession depends on design issues that may influence recession in a positive as well as negative way.

Positive influences are: A gentle down slope (for berm breakwaters 1:1.5); A berm level at least 0.6 H sD above design water level A relatively long berm (extra resiliency, but also less recession) A toe structure at a

the design of the berm breakwater at Keflavik, Iceland in 1983 (Baird and Woodrow, 1987). Since that time, many berm breakwaters have been built in Iceland and through-out the world. The primary advantage of the berm break-water is that the armour stones are smaller than in a con-ventional rubble mound breakwater. Hence, the berm
