The chapter examines the history and evolution of development doctrine. It suggests that the selection and adoption of a development strategy depend upon three building blocks: (1) the prevailing development objectives which, in turn, are derived from the prevailing view and definition of the development process; (2) the conceptual state of the art regarding the existing body of development theories, hypotheses, models, techniques, and empirical applications; and (3) the underlying data ...

The evolutionary history of life on Earth traces the processes by which living and fossil organisms evolved, from the earliest emergence of life to the present. Earth formed about 4.5 billion years ago (abbreviated as Ga (for gigaannum)) and evidence suggests life emerged prior to 3.7 Ga. ago (Although there is some evidence of life as early as 4.1 to 4.28 Ga, it remains controversial due to ...

We may thus conclude that in at least two ways understanding the significance of historical development leads to a clearer vision of why we have what we have, and, perhaps, how it may be expected to evolve. Looking at the present and likely evolution in the immediate future, we can identify at least two significant developments.

This research addresses the origin and evolution of embryonic development and how modifications of development and developmental processes produce novel features. These studies have shown that evolution can alter development to produce new structures, such as embryonic bone structures that develop into the jaw in other animals instead forming part of the middle ear in mammals . Evolution and Development. The study of Evolution has a long and distinguished history in Oxford, beginning with Ray Lankester in the 1890s and thriving through the twentieth century with work on kin selection and the selfish gene by Bill Hamilton and Richard Dawkins, and development of the ' comparative method ' by Paul Harvey and others. Current evolutionary biology research uses field and laboratory studies, experimental evolution and genome analyses on a range of organisms including ...

As nouns the difference between development and evolution is that development is (uncountable) the process of developing; growth, directed change while evolution is (general) gradual directional change especially one leading to a more advanced or complex form; growth; development.

World-class palaeontologists and biologists summarise the state-of-the-art on fish evolution and development.

A large sophisticated telescope complex sits atop a dormant volcano in one of Earth's most remote locations. Some incredibly bright but fiercely independent folks operate it much of the time. They detect, map, and perform threat analysis of near-Earth objects. Shortly after the world narrowly escapes an extinction event, they start collecting pieces of a related cosmic puzzle. When they've connected enough of them, an intriguing and disturbing picture emerges. Yet the most revealing pieces don't reveal themselves until after all life on Earth already has begun marching in lockstep toward possible oblivion.

Scholars argue for the importance of the developmental synthesis, or evo-devo, discussing the history and potential of this growing field of study and presenting specific case studies.

In this highly acclaimed book, Ospovat shows that Darwin's views changed radically from his first formulation of evolution to the publication of the full theory in 1859.

Life history theory seeks to explain the evolution of the major features of life cycles by analyzing the ecological factors that shape age-specific schedules of growth, reproduction, and survival and by investigating the trade-offs that constrain the evolution of these traits. Although life history theory has made enormous progress in explaining the diversity of life history strategies among species, it traditionally ignores the underlying proximate mechanisms. This novel book argues that many fundamental problems in life history evolution, including the nature of trade-offs, can only be fully resolved if we begin to integrate information on developmental, physiological, and genetic mechanisms into the classical life history framework. Each chapter is written by an established or up-and-coming leader in their respective field; they not only represent the state of the art but also offer fresh perspectives for future research. The text is divided into 7 sections that cover basic concepts (Part 1), the mechanisms that affect different parts of the life cycle (growth, development, and maturation; reproduction; and aging and somatic maintenance) (Parts 2-4), life history plasticity (Part 5), life history integration and trade-offs (Part 6), and concludes with a synthesis chapter written by a prominent leader in the field and an editorial postscript (Part 7).
